

Erratum to “Remarks on the phase space for the one-photon production in
electron-proton scattering”

Abstract

I clarify the mistakes in hep-ph/9705427 (Remarks on the kinematics of the one-photon production in electron-proton scattering) about the phase space factor for the one-photon production in electron-proton scattering and confirm that the earlier result given by Kroll, Schürmann and Guichon is right.

In Ref. [1], I claimed that the the phase space factor for the one-photon production in electron-proton scattering presented by Kroll, Schürmann and Guichon [2] is incorrect. This is wrong.

Indeed, as demonstrated in Ref. [2], there are a lot of advantages as one works in the c.m. frame of the virtual Compton scattering, with the z -axis specified to be in the traveling direction of the virtual photon. However, derivation of the correct phase space factor for the cross section formula becomes very tricky. The reason goes like this: As one sets the virtual photon momentum to be in the z -axis, the degrees of freedom of the final-state electron is reduced because of the momentum conservation at the electron-photon interaction vertex.

To derive the correct phase space factor, one should choose *a fixed axis, rather than the moving direction of the virtual photon*, to specify the azimuthal angles of the final-state particles, whatever the working frame is. A convenient choice is to work in the laboratory frame, with the z -axis in the beam direction, in which one can derive the phase space factor presented in Ref. [2] with a little algebra. Of course, one can also derive the correct phase space factor in the c.m. frame of the virtual Compton scattering process. As emphasized above, however, one has to choose a fixed axis to specify the azimuthal angles of the final-state particles.

The phase space boundaries given in Ref. [1] stands intact. In particular, Eq. (28) in Ref. [1] can be used to determine the experimentally accessible region of the c.m. energy squared s for the virtual Compton scattering with fixed beam energy E and photon virtuality Q .

In passing, there is a typographical error in the second reference of Ref. [1], which goes like in Ref. [3].

I thank Markus Diehl for pointing out the mistake.
